

Data Product Manager

About the Role

Masan's businesses generate data at a scale few companies in Vietnam can match — 3,500+ retail touchpoints, FMCG and meat manufacturing, premium F&B, and financial services, all running in parallel. The central Data & AI team is now building data products that make this data actionable for each business unit.

You will own a data product end-to-end for your assigned BU — from understanding the business problem on the ground, to defining what data is needed, to shipping a product that supervisors, managers, and business leaders actually use.

What You'll Do

- Go on-site, understand how operational work is done today, and identify where data can create the most leverage — before writing a single requirement
- Translate operational and business KPIs into data products: dashboards, tracking systems, mobile-first interfaces, workflows
- Own the full product cycle yourself: discovery, roadmap, PRD, build vs. buy, pilot, scale, and adoption
- Define data requirements clearly enough for engineering to build and for business users to trust the output
- Manage senior stakeholders across BU Operations, HR, and functional teams — align them on one roadmap, hold that line
- Drive adoption on the ground — change management is part of the product, not someone else's job

What We're Looking For

- 5+ years in product management, with a track record of owning products end-to-end — spec to post-launch
- Hands-on experience using data to build and run products — you've worked with dashboards, defined metrics, challenged data quality, or shipped analytics-driven features as part of your PM work. A data title isn't required; data fluency is.
- Experience building products for operational or frontline environments — retail, warehouse, manufacturing, F&B, logistics, or similar
- Track record of driving real adoption, not just shipping — you've sat with end users, seen what doesn't work, and fixed it
- Strong stakeholder management: comfortable aligning senior BU leaders and working directly with operational teams in the same week
- Fluent in Vietnamese; comfortable working on-site with operational teams
- Solid PM fundamentals: user stories, prioritization, sprint work with engineering, structured discovery

Nice-to-have

- Prior experience in a data-adjacent role — data analyst, BI, data ops, or building products on top of a data platform
- Background in FMCG, meat/food processing, manufacturing, retail, or agriculture
- Conversational English

Who thrives here

- You go figure things out on the ground before writing requirements — not the other way around
- You're an IC who owns outcomes, not someone who needs a team to execute
- You're comfortable with ambiguity across BUs that have different data maturity, different cultures, and different definitions of the same KPI
- You treat adoption as part of the product — if people aren't using it, the job isn't done

Why this role

- You'll build on a data asset that doesn't exist at this scale anywhere else in Vietnam
- Central team placement means Group-level visibility — your product decisions reach CDO and C-suite
- Active infrastructure investment: Databricks Agentic AI, Workday HCM, ERP modernization — you shape the product layer on top of a platform being built right now
